

Test Vantix Systems

Vantix Systems *A London-based B2B infrastructure startup building real-time event-driven platforms for financial services clients.*

职位: Graduate Software Engineer – Platform Infrastructure 📍 London, UK | Full-time | Hybrid (3 days in office)

About the role

Vantix is scaling its core event processing platform that handles millions of financial data events per second for tier-1 banking clients. You'll be joining a small engineering team responsible for building and maintaining the backend services and deployment infrastructure that power this platform.

This is a hands-on engineering role. You will write production code from day one.

What you'll be doing

- Building and maintaining backend microservices that process real-time financial data streams
- Owning CI/CD pipelines: writing Dockerfiles, Kubernetes manifests, and deployment configs
- Designing and implementing internal tooling to improve developer experience and service reliability (latency monitoring, schema validation, automated testing)
- Collaborating with senior engineers to architect new service integrations under tight delivery timelines
- Participating in on-call rotations and debugging live production issues

What we're looking for

- Proficiency in at least one statically-typed backend language (C#, Java, Go, or similar)
- Demonstrable experience with containerisation (Docker) and orchestration (Kubernetes)
- Familiarity with CI/CD workflows (GitLab CI, Azure DevOps, or equivalent)

- Ability to work under pressure and deliver quickly — hackathon experience or competitive programming is a genuine plus
- Exposure to event-driven or real-time systems is advantageous
- Strong computer science fundamentals (operating systems, data structures, algorithms)

Nice to have (but not required)

- Experience with observability tooling (OpenTelemetry, Grafana)
- Exposure to multi-agent or AI-integrated systems
- Financial services domain knowledge
